**Tuff Tread Treadmills are
Preferred by Fire Departments Nationwide
Here's Why:**

- Durable, self-cleaning, self-lubricating features can withstand harsh, open-air environments, like fire truck bays. Our motors, electronics and belt/deck systems are not susceptible to damage from dust and dirt.
- Unlike ALL other treadmill brands, our self cleaning under-hood compartment requires NO vacuuming or cleaning under the hood. Ever.
- Unlike other treadmill brands, our deck and belt combination require NO lubrication. Ever.
- All steel construction of frame, hood, foot runners, and display protects electronics and other components from damage from dropped dumbbells, and spilled sports-drinks. Everyone else uses plastic – once it's cracked, dirt and dampness attacks the motors, power boards, and display panels.
- RFT coating will not rust, scratch, chip, crack or fade like powder coating and plastic. RFT coating is the same material that's used as bed-liner in fire trucks for its toughness.
- 700 lb user capacity means even the biggest firefighter can train in full gear without coming close to bogging down our machine.
- HRT models include, at no extra charge, the two most widely used firefighter training protocols: Gerkin and WFI
- Treadmill deck is constructed from plywood, not particle board like everyone else's decks. Plywood withstands humidity, and won't deteriorate when damp like particle board will.
- Long life push buttons are water resistant and tested to over 1,000,000 cycles. They will outlast, by 10 times, the soft-touch overlays that everyone else uses, and they can be replaced individually if necessary. If a soft-touch button goes out, you must replace the whole overlay.
